Activity Overview

Systemic sclerosis is a rare connective-tissue disease that affects multiple organ systems and is characterized by extensive fibrosis, autoimmunity, and vascular dysfunction. Interstitial lung disease occurs in most patients with SSc and is now the primary cause of death in these patients. Treatment for SSc-ILD has historically been limited; however, novel therapies are now available and in development. In this curriculum, a panel of expert faculty will offer insight to help clinicians achieve a greater understanding of the recognition, diagnosis, and management of SSc-ILD, including the latest clinical evidence on novel and emerging therapies.

3 Key Reasons to Request Meeting

1. Learn about the signs and symptoms of systemic sclerosis in patients presenting with interstitial lung disease
2. Get the latest information on current and emerging therapies for SSc-ILD, including antifibrotic agents
3. Hear the practical aspects of a multidisciplinary approach for the management of patients with SSc-ILD

Target Audience

These activities have been designed to meet the educational needs of pulmonologists, radiologists, pathologists, rheumatologists, dermatologists, and other clinicians involved in the care of patients with SSc-ILD.

Educational Objectives

Upon completion of this activity, participants should be better able to:

- Identify signs and symptoms of systemic sclerosis in patients initially presenting with clinical features indicative of interstitial lung disease
- Discuss the importance of a multidisciplinary approach in the differential diagnosis and staging of SSc-ILD
- Summarize the latest clinical efficacy and safety data on emerging therapies for SSc-ILD, including antifibrotic agents
- Apply updated evidence-based recommendations for diagnosis, risk assessment, monitoring, and management of SSc-ILD
